When each metro drew its largest share of Middle East arrivals

Hue marks the five−year wave in which the metro's share of the region's US arrivals peaked; opacity marks how many arrivals it received

Arrivals identified from year of immigration (YRIMMIG). For each metro and wave, the measure is the metro's share of all arrivals from this region in that wave, so hue reflects timing. Opacity is the metro's total arrivals from the region over 2000−2019 on a log scale, normalised within this map: the largest metro in a region runs 65 to 205 times the median, so a linear ramp would leave all but a handful at the floor. Opacity is therefore comparable between metros on this map and not between maps. Unshaded counties are either non−metropolitan or belong to a metro that recorded no arrivals from the region, or fewer than 50 across 2000−2019. Metros are drawn as their constituent counties.
Region definitions are stated in the text. Connecticut is drawn on the nine planning regions that replaced its counties as county equivalents in 2022, following the Census Bureau's published correspondence (87 FR 34235, Table 2). The two geographies do not nest, so Connecticut's metro boundaries are approximate; which metro takes which colour is not affected.
